---

We also delved into the dynamics of energy trade between microgrids and distribution network operators (DNOs), and the burgeoning peer ...

This paper proposes an energy market management framework to address the day-ahead optimization of a distribution network (DN) with a multi ...

In this paper, we formulate the direct energy trading among multiple microgrids as a generalized Nash bargaining (GNB) problem that involves the distribution network's operational ...

This paper proposes a hierarchical P2P energy trading model with the incorporation of an energy management scheme for multi-microgrid systems to provide efficient and effective results ...

In this paper, a P2P energy trading hierarchy was proposed for microgrids in distribution networks. Hierarchical P2P markets were established for facilitating the energy trading between prosumers and ...

To address these issues, this paper introduces a model for Transactive Energy Trading (TET) among multiple microgrids within a distribution network.

This work analyzes the impact of P2P energy sharing for three cases - within a microgrid, with neighbouring microgrids, and all microgrids combined together in a distribution system.

In this paper, we investigated direct energy trading among microgrids considering both the economical and technical aspects of the distribution power market and network con-straints.

This paper proposes a distributed trading strategy for microgrids based on a Stackelberg game to enhance the operational benefits of distribution ...
