Solar-driven (photo)electrolysis can convert chemicals into value-added products without the need for energy-intensive processes such as heating.

Green hydrogen is the key to the chemical industry achieving net zero emissions. The chemical industry is responsible for almost 2% of all CO₂ emissions, with half of it coming from the ...

Solar-powered synthesis gas could recycle carbon dioxide into fuels and useful chemicals, an international team of researchers has shown. "If we can generate syngas from carbon dioxide ...

Sunlight is a powerful energy source that scientists can leverage to unlock important chemical conversions. In this study, researchers used solar ...

Solar fuels enable a pathway for sustainable generation of platform chemicals such as butene directly from solar energy, using CO₂ as a feedstock. Industry currently derives butene from fossil fuels. Its ...

Solar chemical refers to a number of possible processes that harness solar energy by absorbing sunlight in a chemical reaction. The idea is conceptually similar to photosynthesis in plants, which converts solar energy into the chemical bonds of glucose molecules, but without using living organisms, which is why it is also called artificial photosynthesis. A promising approach is to use focused sunlight to provide the energy needed to split water into its co...

"If we can generate syngas from carbon dioxide utilizing only solar energy, we can use this as a precursor for methanol and other chemicals and fuels. This will significantly reduce overall CO₂ ...

A solar chemical energy storage system with photochemical process and thermochemical process is proposed to convert full-spectrum solar energy into chemical energy.

On this occasion, we summarize our recent progress in expanding the scope of these technologies beyond H₂

What are the chemical solar generators

production and discuss solar chemical applications more broadly.

Scientific challenges involved with this process include schemes to capture and convert solar energy and then store the energy in the form of chemical bonds, producing oxygen from water ...
