---

Wind speeds increase with height above the Earth's surface. Average hub height is 103m for U.S. onshore wind turbines, 7 and 124m for global offshore turbines. 8.

Climate mitigation scenarios envision considerable growth of wind and solar power, but scholars disagree on how this growth compares with ...

By substantially reducing our dependence on fossil fuels, wind power directly contributes to reducing greenhouse gas concentrations in the atmosphere, slowing the pace of global warming and creating ...

Wind power is a sustainable, renewable energy source, and has a much smaller impact on the environment than burning fossil fuels. Wind power is variable, so it ...

Worldwide, wind power now accounts for more than half of the non-hydroelectric renewable energy. The deployment of wind power is also growing faster than any other segment, ...

The first half of 2025 has been a defining period for the global wind energy sector - not only for its record-breaking growth but for the clarity it provides about the world's energy direction.

Only states with total capacity over 0.1 GW are included per year. Find out more about the data by reading the Wind Vision Report. You can download the data ...

Worldwide solar and wind power generation has outpaced electricity demand this year, and for the first time on record, renewable energies combined ...

Using an Original Institutional Economics (OIE) approach to examine real world developments, we argue that the global wind energy industry is increasingly volatile and ...
